

Replace Urethane Coatings for Wood & Cork Floors with Micron Wood & Cork Seal

A 21st Century Floor Care Technology

NeverStrip Micron Sealers were introduced to the commercial floor care industry during 2013.

Micron Sealers are based on inorganic technology in water, compared to organic urethane coatings.

NeverStrip Micron Sealers are in use across the world within high demand commercial facilities including: airports, convention centers, healthcare facilities, schools, locker rooms, restrooms, etc.

Micron Sealers have been applied onto all types of non-carpet flooring surfaces, indoors and outdoors, including: terrazzo, concrete, rubber, LVT, porcelain, ceramic, VCT (replacing floor finish), epoxy, cork, wood, linoleum, brick, and pavers.

Why use Micron Sealers on Cork and Wood Floors to Replace Urethane Coatings?

- Often refreshable **without** new Sealer applications;
- Applied onto a broad range of urethane coatings or raw wood, cork, bamboo surface with an industry standard product/wood sealer first applied to address raised grain and porosity;*
- Does not require "abrasion"/"conditioning"/"screening" of surface to achieve adhesion;
- Can be spot repaired to remove staining and scratching;
- Available in Low Satin, Satin and Gloss with burnishing. No burnishing dust;
- Less expensive per sq. foot/less cost than urethane coatings due to a superior spread rate;
- 10 minute dry times for reapplication and traffic compared to hours with urethanes;
- Does not yellow - indoors or outdoors;
- Flexible - Does not crack, peel, delaminate, even from glass;
- Multiple year performance, as many as 10 years, within demanding commercial facilities without a reapplication;
- Essentially no odor; attractive traction; simplistic application
