

NeverStrip | 21st Century Floor Care Technology™

Micron Sealers

Protect. Enrich.
No Stripping. Ever.

WHAT ARE MICRON SEALERS?

Micron Sealers, introduced in 2013, are water-based, inorganic floor sealers that superbly bond to any hard surface, including glass, without the need for surface abrasion. At 1.65 micrometers dry film thickness (a human hair is 50–70 micrometers), each application lays down a micron-thin layer of flexible stone-like protection that enriches the floor's appearance and dramatically simplifies long-term maintenance. Unlike traditional floor finish or wax, Micron Sealers do not yellow, soil does not embed into the sealer, and — in normal use — the sealer never needs to be stripped.

KEY BENEFITS

- **Multi-year life between reapplications is common**
 - **No stripping in a normal lifecycle.** Soil stays on the surface — the sealer does not amber or yellow.
 - Sealer can easily be removed if needed
 - Enriches floor color and appearance.
 - Available in Low Satin, Satin, or Gloss sheens.
- **Addresses hard water and soap scum challenges**
- **Makes surfaces easier to clean and keep clean.**
- **Reduces surface care labor.**
 - 10-minute dry times
 - Essentially no odor
 - Meets California VOC standards
- **Protects from grout pigment bleeding and staining.**
- **Provides attractive COF**
- **Cost-effectively refreshable.**
- **Superior to floor finish and wax.** Outperforms on scratch, abrasion, COF, stain, and UV resistance.

SURFACES & APPLICATIONS

Applies to virtually all non-carpet hard surfaces:

- Ceramic & porcelain tile
- Natural stone, terrazzo & concrete
- LVT, VCT & sheet vinyl
- Linoleum, rubber & bio-based tile
- Glass (adheres without mechanical etching)

TYPICAL FACILITY APPLICATIONS

- Fitness & travel center showers and locker rooms
- Commercial kitchens, restaurants & food service
- Healthcare, education & corporate facilities
- Airports, convenience stores & retail
- Anywhere stripping disrupts operations

HOW IT WORKS

Apply a light mist of Micron Sealer and spread immediately with a flat microfiber pad. Work in small sections. Two to three coats are typical, with 10 minutes between applications. Ongoing care mirrors stone floor maintenance: diamond pads remove surface blemishes while restorative cleaner continuously deposits fresh sealer elements. The floor never needs stripping — when refreshing is needed, clean and reseal.

Proven in the Field: Victoria College, TX, is in its 10th year without a single application of sealer. [Read the case study](#) →
